Tuples → immutable

→ a = tuple()

tuple ⇄ list

(*) Lists & tuples & strings can be concatenated using '+'.

→ a = (1, 2, 3)

print(a * 3)

⇒ (1, 2, 3, 1, 2, 3, 1, 2, 3)

Funct:

→ tuple.count()

→ tuple.index()

(*) Indexing in tuples is similar as in lists.

→ similar for loops iteration etc.

Packing & unpacking tuple

$a = 1, 2, 3.14$

Hint $\Rightarrow$ $a = (1, 2, 3.14)$

(auto packing if comma seperated)

print(a)

$\Rightarrow (1, 2, 3.14)$

Unpacking a tuple

$a, b, c = (1, 2, 3.14)$

$\Rightarrow a = 1, b = 2, c = 3.14$

Unpacking with *

$a = (1, \underbrace{2, 3, 4, 5}, 6)$

$x, *y, z = a$

$\Rightarrow x = 1$

$y = 2, 3, 4, 5$

$z = 6$

* picks up all the elements that are possible.

Note $\rightarrow$ if $x, *y = a$.

$\Rightarrow x = 1$

$y = 2, 3, 4, 5, 6$
